October 13, 2023

**23-12155 – August Dekker, et al., v. Secretary, Florida Agency for Health Care Administration et al.**

**CERTIFICATE OF INTERESTED PERSONS**

Pursuant to Eleventh Circuit Rule 25.1, undersigned counsel certifies that the following listed persons and parties not already listed in the CIP contained in the Defendants-Appellants’ initial brief and in any other brief filed have an interest in the outcome of this case:

1. Ethics and Public Policy, *amicus curiae*;
2. Hasson, Mary Rice, counsel for *amicus curiae*; and
3. Kniffin, Eric Nieuwenhuis, counsel for *amicus curiae*.

*Amicus curiae* Ethics and Public Policy is a non-profit 501(c)(3) organization with no corporate parent and is not owned in whole or in part by any publicly held corporation.

Dated: October 13, 2023

s/ Eric N. Kniffin  
Eric N. Kniffin  
*Counsel for Amicus Curiae*

## STATEMENT OF INTEREST OF *AMICUS CURIAE*<sup>1</sup>

The Ethics and Public Policy Center (“EPPC”) is a nonprofit research institution dedicated to applying the Judeo-Christian moral tradition to critical issues of public policy, law, culture, and politics. EPPC has a strong interest in promoting the Judeo-Christian vision of the human person, protecting religious liberty, and responding to the challenges of gender ideology.

Gender ideology has permeated culture with stunning speed, influencing medicine, business, media, entertainment, government, and education. Because gender ideology is sowing confusion and undermining personal well-being, its rise has created an urgent need for clarity, education, and compassionate guidance.

## INTRODUCTION AND SUMMARY OF ARGUMENT

Since the first gender clinic for minors opened in the U.S. in 2007, the number of minors seeking and receiving medical transitioning treatments (puberty blockers, cross-sex hormones, and surgeries) has skyrocketed. This unprecedented surge in transitioning treatments for minors carries a high cost. These treatments are unproven, life-altering, and can lead to significant and irreversible harms, including sterilization, loss of sexual function, and serious mental health problems. Despite the poor evidence base underlying these treatments and the lack of medical consensus supporting them, gender clinicians continue to provide transitioning treatments to minors and medical associations continue to endorse them.

The court below determined that “[t]he overwhelming weight of medical authority supports treatment of transgender patients with [puberty blockers] and cross-sex hormones.” *Dekker v. Weida*, No. 4:22CV325-RH-MAF, 2023 WL 4102243, at \*7 (N.D. Fla. June 21, 2023). On that basis, the court found that the Florida Agency for Health Care

---

[briefs/#16-%E2%80%9Cgender-transition%E2%80%9D-interventions-](#)

Administration violated federal law and the U.S. Constitution when it determined that “gender transitions” for minors are experimental and that, in light of the current state of the *ongoing scientific and political debates* about how best to care for children who express a gender identity that does not reflect their sex, these procedures ought not to be funded with taxpayer dollars.

Respectfully, the district court got it wrong. Contrary to the district court’s characterization, the Defendants-Appellants do not deny that “[g]ender identity is real.” *Dekker*, 2023 WL 4102243 at \*20. The Agency merely disagrees with Plaintiffs-Appellees—and with *some voices* in an *ongoing debate*—about the best way to treat children that presently identify with a gender that is at odds with their sex.

The reality, as shown below, is that there is no national or international medical consensus regarding an authoritative standard of care for the treatment of gender dysphoria or the use of transitioning treatments. This lack of medical consensus has been recognized by the federal government, is reflected in state action, and continues to generate controversy in the medical profession.

The Agency's actions are entitled to a "strong presumption of validity." *Dobbs v. Jackson Women's Health Org.*, 142 S. Ct. 2228, 2284 (2022) ("[H]ealth and welfare laws ... must be sustained if there is a rational basis on which the legislature could have thought that it would serve legitimate state interests."). As the evidence set out below shows, the district court's claims about the state of ongoing scientific and political debate in this area and its attacks on the Agency's motives are inappropriate and unjustified. *Amicus* urges the Court to affirm the reasonableness of the Agency's challenged rule and reverse the decision below.

## ARGUMENT

### **I. There is no national or international medical consensus regarding an authoritative standard of care for gender dysphoria.**

There is no consensus within the medical profession regarding an authoritative standard of care for treatment of gender dysphoria, nor in support of gender-transition interventions. This lack of consensus is reflected historically, internationally, in actions by the federal government and states, and in ongoing debate among medical professionals.

**A. There is no consensus within the medical profession historically.**

Ever since the first gender-transition surgeries were performed in the U.S. in the mid-20th century, there has never been a medical consensus regarding the authoritative standard of care to treat gender dysphoria (previously, “gender identity disorder”) or regarding the risks and benefits of medical “gender transitions.”

Historically, there have been uneven and, at times, competing trajectories in how the psychological and medical communities have responded to an individual’s experience of incongruence between perceived identity and the sexed body. Diagnostic labels, criteria, and interventions have evolved significantly over a relatively short time.<sup>4</sup> Until the late 20th century, “incongruence was taken to justify the need for psychiatric hospitalization and reparative psychotherapy.”<sup>5</sup> More

---

<sup>4</sup> The American Psychiatric Association’s (APA) Diagnostic and Statistical Manual (DSM) changed terminology and diagnostic criteria as follows: “transsexualism” (DSM-III), “gender identity disorder” (DSM-IV), and “gender dysphoria.” *Gender Dysphoria Diagnosis*, APA (2017), <https://www.psychiatry.org/psychiatrists/diversity/education/transgender-and-gender-nonconforming-patients/gender-dysphoria-diagnosis>.

<sup>5</sup> Karl Gerritse et al., *Decision-Making Approaches in Transgender Healthcare: Conceptual Analysis and Ethical Implications*, 24 Med.

recently, the experience of incongruence has been variously classified as “a mental disorder” or “a condition related to sexual health.”<sup>6</sup> (The American Psychiatric Association defines gender dysphoria as “clinically significant distress or impairment related to gender incongruence, which may include desire to change primary and/or secondary sex characteristics.”<sup>7</sup>)

The treatment of gender dysphoria, an “inherently subjective phenomenon,” has been complicated by a “relatively slim (biomedical) evidence base” and a “unique” approach where “a mental health professional determines eligibility for medical treatment.”<sup>8</sup> Not surprisingly, this “convoluted context” results in situations where “experts, clinicians and clients may disagree when it is appropriate to

---

Health Care Philos. 687, 687 (2021), <https://doi.org/10.1007/s11019-021-10023-6>.

<sup>6</sup> The APA classifies “gender dysphoria” under mental health disorders, while the World Health Organization classifies “gender incongruence” under “sexual health.” *Id.* at 688.

<sup>7</sup> Jack Turbrian, ed., *What Is Gender Dysphoria?*, APA (Aug. 2022), <https://www.psychiatry.org/patients-families/gender-dysphoria/what-is-gender-dysphoria>.

<sup>8</sup> Gerritse, *supra* note 5, at 687-88.

initiate medical treatment, how to organize decision-making and how to serve the client’s best interests.”<sup>9</sup>

In the past decade another conflict has emerged, between the “gatekeeping” approach—which relies on mental health professionals to diagnose, and physicians to treat, the patient—and the “informed consent” model, which prioritizes “consumer” autonomy to choose a full range of medical interventions “without [a] mental health evaluation” or “formal diagnosis.”<sup>10</sup>

Activists now press for full “depathologization” of “transgender” identities, calling for “the removal of the diagnostic classification of gender transition processes as a mental disorder from the [Diagnostic and Statistical Manual] and the [International Classification of Diseases], [a change] from a psychiatric assessment process towards an informed decision-making approach ... [and] depathologization of gender diversity in childhood.”<sup>11</sup> The continued conflicts over basic issues of

---

<sup>9</sup> *Id.* at 688.

<sup>10</sup> *Id.*

<sup>11</sup> Amets Suess Schwend, *Trans Health Care from a Depathologization and Human Rights Perspective*, 41 *Pub. Health Rev.* 1, 4 (2020), <https://doi.org/10.1186/s40985-020-0118-y>.

diagnosis, appropriate interventions, and even the validity of mental health assessments in connection with gender-transition interventions reflects the ongoing lack of medical consensus.

The care for gender-dysphoric minors also lacks medical consensus. A decade ago, responding to a child's gender dysphoria with "watchful waiting" or family therapy was not controversial because, in most cases, the child's gender incongruence resolves by puberty.<sup>12</sup> In contrast, the use of gender-transition interventions for minors has been controversial since its inception.

The Dutch researchers who pioneered the use of puberty suppression for minors acknowledge persistent skepticism towards their work, including from providers concerned that gender dysphoria "can only be diagnosed with certainty in adulthood"; they feared "disapproval of the peer group, reactions of the correctional medical boards, or litigation."<sup>13</sup>

---

<sup>12</sup> Devita Singh et al., *A Follow-Up Study of Boys with Gender Identity Disorder*, 12 *Front. Psychiatry* 632784, 12-13 (2021), <https://pubmed.ncbi.nlm.nih.gov/33854450/>.

<sup>13</sup> Peggy Cohen-Kettenis et al., *The Treatment of Adolescent Transsexuals: Changing Insights*, 5 *J. Sexual Med.* 1892, 1893 (2008), <https://doi.org/10.1111/j.1743-6109.2008.00870.x>.

In 2007, Dr. Norman Spack opened the first U.S. pediatric gender clinic at Boston Children’s Hospital and introduced puberty suppression for minors. With scant research available, he viewed “stopping puberty” as “a diagnostic test.”<sup>14</sup> If it brought relief, the diagnosis was right.

No professional medical society recommended medically treating gender dysphoria in minors until 2009,<sup>15</sup> when the Endocrine Society released Clinical Practice Guidelines supporting puberty suppression and cross-sex hormones for minors—despite lacking “rigorous evaluation of the effectiveness and safety of endocrine protocols.”<sup>16</sup>

In 2012, the World Professional Association for Transgender Health (WPATH), an early promoter of gender-transition interventions for

longitudinal impact of treatments that are *already being used* in clinical settings.”<sup>40</sup>

The original Dutch studies that formed the empirical basis for the “gender-affirming” approach have undergone new scrutiny. Scholars have sharply criticized the Dutch studies for their “methodological biases,” weak evidence base, and “profound limitations,” and concluded the studies “should never have been used as justification for propelling these interventions into general medical practice.”<sup>41</sup> Dr. Susan Bradley, a pioneering gender clinician in Canada, has expressed regret for adopting the Dutch model and using puberty suppression in minors: “We were wrong.”<sup>42</sup> She realized that gender-transition interventions are “not

as irreversible as we always thought, and they have longer term effects on kids' growth and development, including making them sterile and quite a number of things affecting their bone growth.”<sup>43</sup>

**C. WPATH and Endocrine Society guidelines are not the standard of care.**

Activists claim WPATH guidelines represent the “professional consensus about the psychiatric, psychological, medical, and surgical management of gender dysphoria.”<sup>44</sup> But WPATH itself only claims that it has issued “flexible” guidelines.<sup>45</sup> Indeed, HHS’s Centers for Medicare & Medicaid Services (CMS) cited the “flexibility” of WPATH’s guidelines when it declined to endorse WPATH guidelines as the standard for Medicare coverage determinations.<sup>46</sup>

WPATH guidelines lack the rigor and evidence base necessary to qualify as authoritative standards of care or clinical practice guidelines (CPGs).<sup>47</sup> A 2021 first-of-its-kind systematic analysis of international CPGs for “gender minority/trans health,”<sup>48</sup> published in the British Medical Journal (BMJ), reviewed WPATH SOC 7 guidelines, singled them out for particularly strong criticism, and concluded they “cannot be

---

<sup>47</sup> Deutsch et al., *supra* note 32. Trustworthy CPGs “should be based on a systematic review of the existing evidence; be developed by a knowledgeable, multidisciplinary panel of experts and representatives from key affected groups; consider important patient subgroups and preferences, as appropriate; be based on an explicit and transparent process that minimizes distortions, biases, and conflicts of interest; provide a clear explanation of the logical relationships alternative care options and health outcomes, and provide ratings of both the of evidence and the strength of recommendations; and be reconsidered and revised as appropriate when important new evidence warrants modifications of recommendations.” IOM Committee on Standards for Developing Trustworthy Clinical Practice Guidelines, *Clinical Practice Guidelines We Can Trust*, at 3 (Robin Graham et al. eds., 2011), <https://www.ncbi.nlm.nih.gov/books/NBK209546/> (cleaned up).

<sup>48</sup> Sara Dahlen et al., *International Clinical Practice Guidelines for Gender Minority/Trans People: Systematic Review and Quality Assessment*, 11 *BMJ Open* 1, 8 (2021), <https://pubmed.ncbi.nlm.nih.gov/33926984/> (describing an overall “paucity” of “high quality” clinical guidance regarding gender dysphoria and transitioning treatments).

considered ‘gold standard.’”<sup>49</sup> Patrik Vankrunkelsven, the Director of the Belgian Center for Evidence-Based Medicine (CEBAM), extended those criticisms to WPATH SOC 8 and called gender-transition interventions “a pure experiment on children, without any scientific evidence.”<sup>50</sup> From a professional standpoint, Vankrunkelsven pointed out that “if we had to review [the WPATH guidelines] at CEBAM, we would actually toss them in the bin [trash].”<sup>51</sup>

Similarly, the Endocrine Society’s guidelines are “fundamentally flawed” according to Gordon Guyatt, the co-developer of the GRADE “evidence-based” review protocol.<sup>52</sup> Before issuing its 2009 guidelines supporting gender-transition interventions for minors, the Endocrine Society conducted a substantive evidence review, using GRADE methodology. However, the review had “serious problems,” according to Guyatt, especially as it focused on two side effects (cardiovascular and

<sup>52</sup> *The Evidence*, *supra* note 25.

bone health) while failing to assess the main outcome desired (reducing gender dysphoria).<sup>53</sup> The Society also “paired strong recommendations—phrased as ‘we recommend’—with weak evidence,” in violation of GRADE protocols.<sup>54</sup>

Like WPATH’s “standards,” the Endocrine Society’s recommendations rely on “low” and “very low” quality evidence and included a disclaimer that its “guidelines cannot guarantee any specific outcome, nor do they establish a standard of care.”<sup>55</sup>

No current guidelines for treating gender dysphoria qualify as an authoritative CPG or standard of care, and clinicians with diverse perspectives recognize that no medical consensus exists. In practice, gender medicine freely disregards existing guidelines. A 2020 study from the Mount Sinai Center for Transgender Medicine and Surgery notes that WPATH guidelines “are often considered the standard of care for [transgender] people throughout the world,” but characterizes them as a

---

<sup>53</sup> J. Block, *Gender Dysphoria in Young People Is Rising—And so Is Professional Disagreement*, 380 *BMJ* 382, at 2-3 (2023), <https://www.bmj.com/content/380/bmj.p382>.

<sup>55</sup> Hembree et al., *supra* note 21, at 389521.

“barrier to care,” “impractical,” unclear, and detrimental to patient wellbeing.<sup>56</sup> Indeed, Mount Sinai eventually developed its own criteria for gender-transition interventions—criteria that diverged significantly from WPATH guidelines: less than ten percent of Mount Sinai patients meeting criteria for both WPATH and Mount Sinai assessments.<sup>57</sup>

Although gender clinicians tout the “substantial” mental health evaluations occurring before transition, the role of mental health providers varies widely by clinic.<sup>58</sup> Seattle Children’s Gender Clinic offers “brief mental health support” but no ongoing mental health therapy.<sup>59</sup> Other clinics, such as Boston Children’s, conduct “comprehensive psychological and medical assessments.”<sup>60</sup> Two veteran gender

clinicians, Dr. Erica Anderson and Dr. Laura Edwards-Leeper, have warned that some adolescents receive “sloppy care” from clinicians who start them on transitioning treatments with minimal psychological assessments.<sup>61</sup> Edwards-Leeper recently lamented that many “providers do not value the mental health component,” which results in children being “pretty much fast tracked to medical intervention.”<sup>62</sup> De-transitioners (formerly trans-identified people who regret and discontinue gender-transition interventions) report minimal or no mental health treatments before medicalized interventions.<sup>63</sup>

Several other circuit courts have recognized that WPATH guidelines do not reflect medical consensus. *See Gibson v. Collier*, 920 F.3d 212, 223 (5th Cir. 2019) (“WPATH Standards of Care do not reflect medical consensus”); *Doe v. Snyder*, 28 F.4th 103, 112 (9th Cir. 2022) (affirming district court’s reliance on “expert testimony that WPATH’s

Dep’t of Corr. Sec’y*, 952 F.3d 1257, 1296 (11th Cir. 2020) (finding that district court and others have found WPATH standards “authoritative for treating gender dysphoria in prison,” without evaluating merits of WPATH standards); *Edmo v. Corizon, Inc.*, 935 F.3d 757, 787, 788 & n.16 (9th Cir. 2019) (per curiam) (holding WPATH standards are the “established standards” for evaluations of the necessity of transitioning surgery and the “undisputed starting point in determining the appropriate treatment for gender dysphoric individuals”), *reh’g en banc denied*, 949 F.3d 489, 497 (9th Cir. 2020) (O’Scannlain, J., joined by seven judges, respecting the denial of rehearing en banc) (rejecting panel’s characterization because “WPATH Standards are merely criteria promulgated by a controversial private organization with a declared point of view”).

**D. The lack of medical consensus is reflected internationally.**

Many countries that initially embraced gender-transition interventions have recently reversed course.<sup>64</sup> For example, Sweden's National Board of Health and Welfare commissioned an extensive evidence review and concluded in 2022 "that the risks of anti-puberty and sex-confirming hormone treatment for those under 18 currently outweigh the possible benefits."<sup>65</sup> Finland likewise revised its protocols: the Finnish Health Authority performed an extensive literature review then issued new guidelines prioritizing psychotherapy as the first-line treatment for gender-dysphoric minors.<sup>66</sup>

In the United Kingdom, whistleblower complaints exposed the inadequate psychological care for gender-dysphoric minors at the National Health Service's (NHS) gender clinic.<sup>67</sup> A landmark case against the NHS in 2020 by “de-transitioner” Keira Bell found that minors lacked capacity to consent to transitioning treatments that cause sterility and impair sexual function. The NHS initially suspended the use of puberty blockers and instituted new procedures to ensure better psychological care.<sup>68</sup> (The decision was later reversed on procedural grounds.)

Two separate evidence reviews assessing the impact of puberty suppressing drugs and cross-sex hormones to treat gender dysphoria were published in 2021 by the UK's National Institute for Health and Care Excellence (NICE). The NICE evidence review found little evidence

<sup>75</sup> A summary of the Norwegian report by the Society of Evidence-based Gender Medicine is available here: @segm\_ebm, Twitter (Mar. 9, 2023, 8:24 PM), [https://twitter.com/segm\\_ebm/status/1634032333618819073](https://twitter.com/segm_ebm/status/1634032333618819073).

Many studies confirm that socially transitioning a child has important psycho-social and psychological consequences. Early Dutch research found social transition can make it difficult for a child to reverse course.<sup>76</sup> More recently, studies in the United Kingdom,<sup>77</sup> Sweden,<sup>78</sup>

the child to embrace his or her biological identity and predisposes the child to pursue irreversible medical transition. Furthermore, as a 2023 journal article concluded, there are “no significant effects of social transition or name change on mental health status.”<sup>84</sup>

**E. The federal government has recognized the lack of medical consensus.**

Despite the efforts under the current administration to push gender-transition interventions, the federal government has never formally determined that such treatments are the appropriate standard of care.

In June 2020, HHS acknowledged that “there is no medical consensus to support one or another form of treatment for gender dysphoria.”<sup>85</sup> HHS found that its prior regulations supporting gender-transition surgeries “relied excessively on the conclusions of an advocacy group (WPATH) rather than on independent scientific fact-finding,” such

as the CMS factfinding for its most recent National Coverage Determination.<sup>86</sup> After its factfinding, CMS declined to issue a National Coverage Determination on gender-transition surgeries for Medicare beneficiaries with gender dysphoria “because the clinical evidence is inconclusive.”<sup>87</sup> “Based on an extensive assessment of the clinical evidence,” CMS determined that “there is not enough high quality evidence to determine whether gender reassignment surgery improves health outcomes for Medicare beneficiaries [which include non-seniors] with gender dysphoria and whether patients most likely to benefit from these types of surgical intervention can be identified prospectively.”<sup>88</sup>

Similarly, a 2018 Department of Defense report on gender dysphoria found that there is “considerable scientific uncertainty and overall lack of high quality scientific evidence demonstrating the extent to which transition-related treatments, such as cross-sex hormone therapy and sex reassignment surgery—interventions which are unique in psychiatry and medicine—remedy the multifaceted mental health

<sup>88</sup> *Id.*

problems associated with gender dysphoria.”<sup>89</sup> Indeed, none of the drugs used to block puberty and induce cross-sex masculine or feminine features are approved as safe or effective for such uses by the FDA and the NIH only began investigating the long-term outcomes of transitioning treatments for youth in 2015.<sup>90</sup>

**F. State action reflects the lack of medical consensus.**

State actions reflect the lack of medical consensus for the appropriate standard of care for gender dysphoria and transitioning interventions, especially for minors. At least twenty-one states have passed laws prohibiting gender-transition interventions on minors.<sup>91</sup>

**II. Gender-transition interventions can lead to serious harms.**

Gender-transition interventions can cause significant harms, including loss of fertility and sexual function. Long-term outcomes for

elsewhere.”<sup>94</sup> The typical patient profile has changed markedly. In the past, patients seeking treatment for gender dysphoria were usually either adult males or very young children, mostly male. Today, the typical patient is an adolescent, usually female.<sup>95</sup>

For years, gender dysphoria in children was addressed through “watchful waiting” or family therapy. Under this approach, about eighty-eight percent of the time, the child’s gender dysphoria resolved naturally by puberty.<sup>96</sup> The “gender-affirming” approach changed that pattern dramatically: most children affirmed in their transgender beliefs persist in those beliefs and are likely to pursue transitioning treatments that irreversibly modify their bodies—and lead to regret.<sup>97</sup>

Clinical concerns over gender-transition interventions have escalated.<sup>98</sup> Puberty blockers, originally praised as safe and fully reversible, are known to have negative effects on bone density, social and emotional maturation, and other aspects of neuro-development.<sup>99</sup> They generally fail to lessen the child's gender dysphoria, and deliver mixed results for mental health.<sup>100</sup> Long term effects remain unknown.<sup>101</sup>

Nearly all children who begin puberty blockers go on to receive cross-sex hormones, with life-altering consequences.<sup>102</sup> Blocking a child's natural puberty prevents maturation of genitals and reproductive organs; subsequently introducing cross-sex hormones renders the child permanently sterile.<sup>103</sup> Puberty suppression may also impair the child's

later sexual functioning as an adult.<sup>104</sup> These losses cannot be fully comprehended by a child, making informed consent impossible.

Cross-sex hormones carry numerous health risks and cause significant irreversible changes in adolescents' bodies, including genital or vaginal atrophy, hair loss (or gain), voice changes, and impaired fertility.<sup>105</sup> They increase cardiovascular risks and cause liver and metabolic changes.<sup>106</sup> The flood of opposite sex hormones has variable emotional and psychological effects as well. Females taking testosterone experience an increase in gender dysphoria, particularly regarding their breasts, which heightens the likelihood they will undergo double mastectomies—as young as thirteen.<sup>107</sup> Far from an evidence-based standard of care, transitioning treatments for gender dysphoria amount
